

Water's Edge

Location

The existing stormwater management facility is located on Johnsville Road just southwest of the intersection of Johnsville Road and Sykesville Road in Sykesville. Originally constructed in 2003, this facility provides quantity control but no water quality treatment.

Description

The proposed retrofit will convert the existing facility into a surface sand filter optimized to provide water quality volume and channel protection and management of the 2- and 10- year storm events back to forest/meadow conditions. The drainage area to the facility is 43.52 acres, with 28.61 acres of impervious area.
